

Professional tip

The fast track to the finished furniture surface (corpus – furniture and chairs)

Treatment suggestions

With GORMOS Wax Oil N° 267 it is possible to obtain furniture surfaces which are both, waxed and oiled, with one single treatment. The wax oil gives them a unique velvet soft surface and emphasizes the color of their grain. Moreover, GORMOS surfaces show only a very slight tendency to yellowing.

Pre-sanding and treatment

Before coating the surface, sand it with sandpaper or sponge grain size 240 to 320. The finer the grain, the better. Then apply the GORMOS Wax Oil swiftly with a bale, cotton cloth or a spraying device.

Let it sit for 10 to 60 minutes, depending on the type of wood and the desired saturation level. Then take off the supernatants and dry polish the surface.

Now your wood surface is already touch dry. After 12 - 24 hours, it can be packaged.

If the wood shows many swirls and branch areas, or if you want to increase the "wax level" and stability, it is possible to obtain a thicker layer by applying a second thin coat the following day.

Water stains

Water stains can be removed as follows:

Polish small spots with a cotton cloth. Through the resulting heat the wax film begins to "flow" and the stain disappears.

For larger areas, you can obtain the necessary heat with help of a hair dryer (only solid wood).

Damaged areas

First sand with sandpaper grain size 600 to 1000 in order to smooth the swollen fibers. Then apply the GORMOS Wax Oil and let it soak in for up to 12 hours. Thereafter, remove the supernatant and polish the surface.
