

Tips & ideas

New coatings for all woods

Ordner-No.: 1170-5 - as of November 2019

Sun and wind, humidity and pollutants from the air, plus constantly fluctuating temperatures: wood outdoors is exposed to a variety of stresses. However, with the right coating applied to a professional construction, the durability of wood is practically unlimited, even outdoors.

For more than 40 years, LIVOS has been using the active ingredients of plants for its paints and maintenance products. Benefit from this experience! LIVOS offers products in many colors also for your external façade, terrace, front door or windows.

Further information can be obtained from your LIVOS distributor or directly from LIVOS. You can also use our website www.livos.co.uk and our hotline +49(0)5825 - 88 30.

Processing information

Deciduous and coniferous woods must first be primed. This reduces their absorbency and ensures an optimum adhesion of paints and stains. In addition, a reliable protection against blue stain is achieved with coniferous woods.
